#### Abstract

The polycrystalline NaCaPO<sub>4</sub>: Eu phosphor was developed by using solid state diffusion method (SSD). The structure of NaCaPO<sub>4</sub>: Eu phosphor confirmed by using X-ray diffraction pattern and crystal structure of NaCaPO<sub>4</sub>: Eu phosphor was orthorhombic with space group Pnam (62). The prepared NaCaPO<sub>4</sub>: Eu phosphor showed excellent luminescence (TL/OSL) responses under  $\beta$  irradiation. The TL glow curves were consists over lapping peaks in temperature range 200-450°C and peak fit software was used for deconvolution of this peak. The peak shape method was employ for calculation of kinetics parameters. The photoluminescence spectra of NaCaPO<sub>4</sub>: Eu phosphor showed outstanding TL/OSL properties hence this phosphor is suitable candidate for radiation dosimetry.

Keywords: Solid state lighting, TL/OSL,  $\beta$  irradiation, Kinetics parameter.

## Introduction

OSL technique is a now well-developed for its application in radiation dosimetry. Antonov Romanovskii *et al.* firstly suggested use of OSL for personal dosimetry<sup>1</sup>. The OSL technique most popular for personnel dosimetry only after the development of crystalline  $Al_2O_3$ :  $C^{2,3}$ . The OSL technique is applicable for personnel dosimetry, environmental dosimetry, medical dosimetry, space dosimetry<sup>4-6</sup>.

Now day various phosphates, borate, sulphate based OSL materials available for personal, environmental and medical dosimetry applications<sup>7-11</sup>. The phosphate base ABPO<sub>4</sub> compound (A=Li<sup>+</sup>, Na<sup>+</sup>, K<sup>+</sup> -monovalant cations, B= Mg<sup>2+</sup>,  $Ca^{2+}$ ,  $Sr^{2+}$ ,  $Ba^{2+}$  -divalent cat ions) show excellent luminescence (TL/OSL) properties. These compounds show excellent thermal, hydrolytic stability and magneto electric properties. However NaCaPO<sub>4</sub>:RE compound is including in ABPO<sub>4</sub> phosphate family and effective atomic number (Zeff=14.63) is nearly same as effective atomic number of human tissue  $(Z_{eff}=7.4)^{12}$ . Grandhe et al. reported NaCaPO<sub>4</sub>:RE (RE=  $Eu^{3+}$ ,  $Eu^{2+}$ ) phosphor for white light application and display device<sup>13</sup>. Qin etal. developed NaCaPO<sub>4</sub>:Eu<sup>2+</sup> phosphor via high temperature solid state method and this phosphor applicable for green emitting for W-LED<sup>14</sup>. Li et al. developed Mn doped NaCaPO<sub>4</sub> phosphor via sol-gel process and reported this phosphor for field emission displays<sup>15</sup>. From above literature survey we observed that NaCaPO<sub>4</sub>: M (M= Eu, Mn and rare earth (RE)) phosphor is applicable for solid state lighting (SSL).

In the present paper, NaCaPO<sub>4</sub>:Eu phosphor was developed by using SSD method and its TL/OSL properties under  $\beta$  irradiation studied.

# Methodology

The polycrystalline NaCaPO<sub>4</sub>: Eu phosphor was developed by using SSD method<sup>16</sup>. Phase purity of NaCaPO<sub>4</sub>:Eu phosphor was checked by using X-ray diffraction (XRD) using a Rigaku miniflex II diffractometer with Cu Ka ( $\lambda$ = 1.5405 Å) operated at 5 kV. Irradiations of all the samples were performed at room temperature using a calibrated <sup>90</sup>Sr/<sup>90</sup>Y  $\beta$  source in-housed in RISO TL/OSL Reader (DA-15 Model).

The TL/OSL measurement was carried out using an automatic RISO TL/OSL-DA-15 reader at RPAD, BARC (Mumbai). The PL and PL excitation (PLE) spectra were measured on (Hitachi F-7000) fluorescence spectrophotometer<sup>17</sup>.

#### **Results and Discussion**

**X-ray Diffraction pattern:** The XRD pattern of the NaCaPO<sub>4</sub>:Eu phosphor was shown in Figure-1. The patterns matched with the International Center for Diffraction Data (ICDD) having card no.-00-029-1193.

They were in good agreement with the ICDD file in terms of peak position as well as intensity.

**CW-OSL response (continuous wave optically stimulated luminescence):** The sample was studied for its OSL response using blue LED stimulation (470 nm)<sup>8</sup>. Figure-2 shows the CW-OSL response of NaCaPO<sub>4</sub>:Eu phosphor for 100mGy of  $\beta$ -irradiation. Also CW-OSL curve fitted with 3<sup>rd</sup> order exponentially decay and found three components such as fast, medium and slow.

**Thermoluminescence (TL):** Figure-3 represent TL glow curve of NaCaPO<sub>4</sub>:Eu phosphor under  $\beta$ -irradiation. The peak fit software was used for deconvolution of TL glow curve<sup>18,19</sup>. The peak shape method was employ for calculation of kinetics parameters<sup>20-22</sup>. The calculated kinetics parameters such as activation energy, frequency factor and order of kinetics were given in Table-1.

**Photoluminescence** (**PL**): The combined excitation and emission spectra of NaCaPO<sub>4</sub>:Eu phosphor was shown in Figure-4. The excitation and emission spectra were observed under 613 and 393 nm respectively. From Figure-4 excitation spectra consists sharp peaks at 393 nm corresponds to the  ${}^{7}F_{0}$ - ${}^{5}L_{6}$  transition. The emission spectra consist of also sharp peaks at 595nm and 613 nm correspond to  ${}^{5}D_{0}$  - ${}^{7}F_{0}$  and  ${}^{5}D_{0}$  - ${}^{7}F_{2}$  transitions<sup>23</sup>.

# Conclusion

Polycrystalline sample of NaCaPO<sub>4</sub>:Eu phosphor was successfully developed by using SSD method. The XRD pattern of prepared phosphor was well match with ICDD files with card No. 00-029-1193 and phosphor shows excellent luminescence (TL/OSL) properties. The TL glow curve of prepared phosphor was observed in temperature range 50-500°C. The peak shape method was utilized to calculate the kinetic parameters, i.e., activation energy and frequency factor from the TL glow curve. The CW-OSL response of prepared phosphor was show fast decay curve and fitted with 3<sup>rd</sup> exponentially decay. The photoluminescence spectra of prepared phosphor were show emission in red-orange regions under Near-UV excitation.
